Purpose
To assist and encourage private generation of electricity through usage of solar power, while assuring that such generation does not create electrical, structural, fire or life safety hazards.

Scope
This Construction Tip Sheet may only be used for single-family, two-family and townhome buildings, as defined by the International Residential Code.

Definitions
PV means Photo-Voltaic
NEC means National Electrical Code

Permit and Installation Requirements
PV panel installations require a building permit unless exempted in this section. All PV installations require an electrical permit. Some jurisdictions also require electrical plan review.

Except for the cities of Snoqualmie and Woodinville, the installation of roof mounted PV solar panels meeting all of the following criteria will not require a building permit:

• Total dead load of panels, supports, mountings, raceways and all other appurtenances weigh no more than three pounds per square foot.
• The total PV solar panel system weight will not exceed 1,000 pounds.
• Panels are to be mounted no higher than 18” above the surface of the roofing to which they are affixed. Except for flat roofs, no portion of the system may exceed the highest point of the roof. Panels on flat roofs cannot exceed the maximum height allowed for the building unless approved by the local jurisdiction.
• Supports for solar panels are to be installed to spread the dead load across as many roof-framing members as needed to ensure that no point loads in excess of fifty pounds are created.
• Attachment to the roof will be as specified by the mounting system manufacturer.
• All signage and markings required by NEC 690 shall be a phenolic or metallic plate or other similar material engraved in block letters at least 1/4" high and suitable for the environment and application. The letters and the background shall be in contrasting colors. Screws or rivets shall be used to affix an identification plate to the equipment or enclosure.
• The installation must still comply with all land use and other applicable codes even if a building permit is not required.

GENERAL INFORMATION:
• Obtain an electrical permit before starting construction.
• This tip sheet is intended to provide a policy for MBP jurisdictions.
• Additional information can be found at your local building department.
Additional Signage and marking Requirements
In addition to the signage and markings required in NEC 690 an Identification Plate is needed to provide emergency responders with appropriate warning regarding the solar electric system and must comply with the following:

- Identification Plate text: “WARNING: PHOTOVOLTAIC POWER SOURCE”
- Red background, white lettering
- Minimum 3/8” letter height, all capital letters
- Arial or similar font, non-bold
- Reflective, weather resistant material
- The marking should be placed on the exterior of structure adjacent to the meter and within the main service disconnect. If the main service disconnect is operable with the service panel closed, then the marking should be placed on the outside cover.

Electrical Permits and Inspections
Electrical permits and inspection approvals are required for all PV installations that connect to the building’s electrical system. Some electrical jurisdictions require an electrical plan review prior to the permit issuance. Be sure to check with your local jurisdiction to determine if electrical plan review is required. If a plan review is not required, the following information must be provided to the electrical inspector at the time of the electrical inspection:

- A wiring diagram showing all photovoltaic equipment, devices, wire type and size, over-current protection and grounding.
- Electrical calculations used to determine voltage and current within the photovoltaic system.
- Information/specifications for all equipment (array, inverter, modules including operating and maximum voltages/currents/power, etc.).

Firefighter Access
PV systems are a serious concern for the fire service in that they limit access for roof operations and, even when disconnected from the building electrical system, remain energized during daylight hours. The following recommendations are made to help mitigate these concerns; and while not currently required by the 2009 International Fire Code, these recommendations are expected to become requirements in the 2012 International Fire Code.

Access
- A pathway should be constructed along all roof edges, peaks, and valleys for firefighter access.
- The pathway should be not less than 36” wide measured from the edge of the solar array. (See attached figures 1-4 for examples of firefighter pathways).
- When solar arrays are installed on roofs, there should be a minimum of 36” of clearance at the ridgeline to allow for smoke ventilation.
- This guideline does not apply to non-habitable structures without concealed attic/roof spaces. Examples of non-habitable structures include, but are not limited to, parking shade structures, carports, solar trellises, etc.
